

With Control4® Composer software you can forget about difficult, time-consuming programming and focus more on your customers. No need to hire a C programmer to spend days, if not weeks, to automate a home. With Control4 Composer you can now configure an average home automation project, including touch screens and keypads, in a couple of hours or less.

Built with true drag-and-drop functionality, Control4 Composer makes configuring an entire home as easy as using a word processor. Even the most complicated project can be completed in just a few easy steps. Rooms are easily defined, devices are simple to add, and setting connections is an absolute breeze. And with the use of the custom templates called Control4 System Agents, many complex sequencing events have already been pre-programmed for simple configuration.

It's all part of the Control4 vision. We bring the benefits of a truly automated home to more people with solutions that are affordable, easy to install and designed to adapt to any home or lifestyle.

Features and Benefits

Easy to Use

- **Interview mode** — Be guided through the configuration process with a series of questions. Like popular tax preparation software, just answer questions and fill in the blanks. An advanced mode is also available for more direct control and customization.
- **Drag and drop functionality** — Simply drag and drop devices to tell Control4 Composer where you want them and what you want them to do. There's no syntax to understand and no device addresses to remember.
- **System agents** — Time saving templates for commonly used automated functions such as lighting scenes, wake up sequencing, occupancy simulation and scheduling of automation have been incorporated to make complex tasks simple.
- **Easy, customizable sequencing** — Any custom sequence you can dream up can be quickly configured without calling in a programmer.
- **Integrated Media Manager** — Control4 Composer's built-in Media Manager automatically recognizes all the digital media in a homeowner's collection and stores the indexed collection on the system controller for easy access.

State-of-the-Art Technology

- **Remote access** — Projects can be opened from remote locations and changed over the Internet. This allows you to make programming changes, large or small, from the comfort of your own office and reduces the need for programming-related service calls.
- **Live system** — All Control4 Composer actions are done on a real-time basis, making it easy to test the programming while you still have the project open. The auto save function helps keep the data safe even while the project is being updated or developed.
- **Backward and forward compatible** — All home automation projects configured using Composer are saved in a format that will work with older and future versions of the software. This guaranteed compatibility ensures that you will always have a functional project configuration, no matter when you started using the program.

*Save time and money while getting more jobs done than ever before. Set up projects with **drag and drop ease**, or use the **Composer Interview** to complete projects.*

Composer Interview Screen

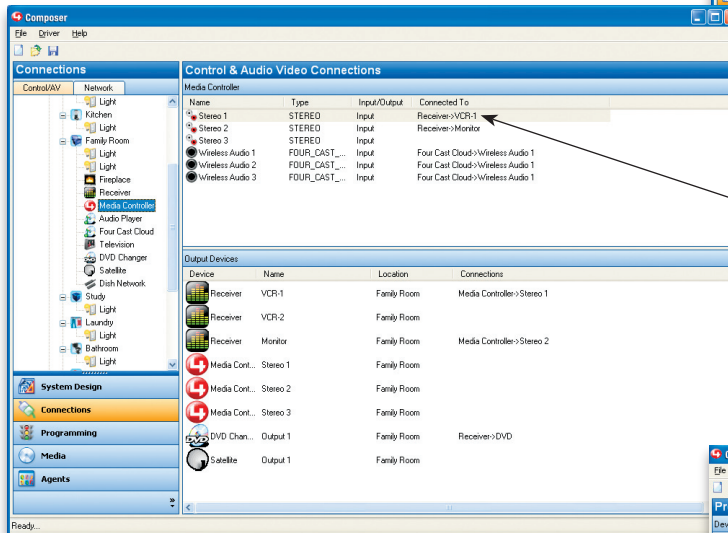

Developing a project has never been easier or more intuitive

1. Identify the area you want to design.

Select the building, floor, and rooms you want to automate. The graphical icons and hierarchical design make it simple to set up the rooms for the entire project.

2. Identify the devices you want to control.

Specify the devices to be added to the room from a comprehensive list and then drag and drop the items into each room. Composer's auto detection functionality will then help you find specific drivers and IR codes for a huge selection of devices in seconds.

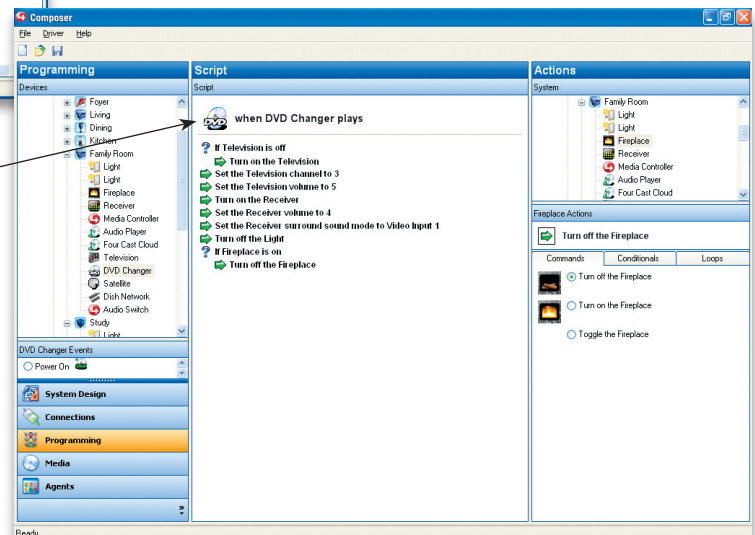

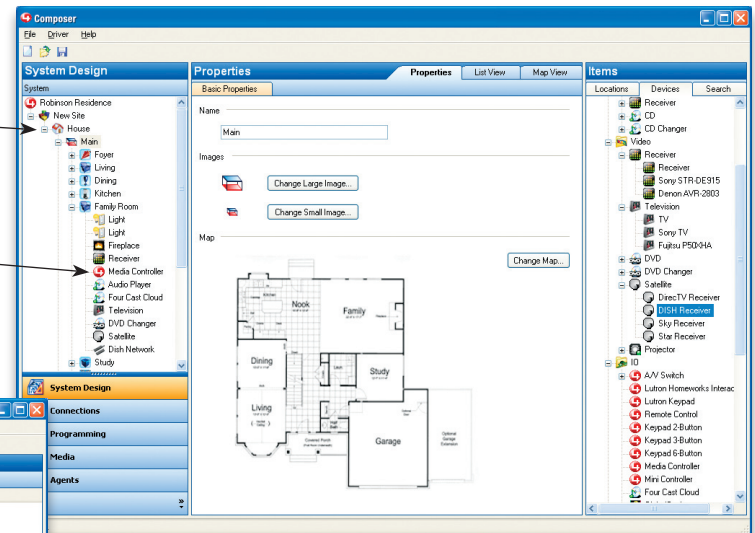

3. Specify how all the devices are connected.

Enter the connections, control bindings, and device addresses only once and they're permanently stored in the project. The drag and drop menu along with the automatic discovery of network addresses make this normally time-consuming process much easier.

4. Specify how all the devices are controlled.

Develop customized automation sequences in seconds with easy drag-and-drop programming. Simply drag and drop devices to tell Composer what you want to do, from simple automation to complex sequences. There's no syntax to understand, and no device addresses to remember.

What about Touch Screens?

Custom touch screens are automatically created for you. Composer allows you to deliver touch screen interfaces with none of the work. By simply creating the project, touch screen interfaces are automatically generated. Then, you can select from a variety of skins to further customize the experience.

Media Management Made Easy

Setting up user media has never been easier. The built-in Media Manager automatically recognizes and indexes all the digital media in a homeowner's collection. From the CDs and DVDs loaded in their changers to the digital music directories on the home network, Composer makes setting up and choosing music, movies, and television channels a snap.
